Experiment9:

Write a program in C that creates a child process, waits for the termination of the child and lists its PID.

Command: nano filename.c

```
Program: #include<unistd.h>
```

```
#include<sys/types.h>
#include<stdio.h>
#include<sys/wait.h>
int main()
{
pid_t p;
printf("before fork\n");
p=fork();
if(p==0)
{
printf("I am child having id %d\n",getpid());
printf("My parent's id is %d\n",getppid());
}
else
{
wait(NULL);
printf("My child's id is %d\n",p);
printf("I am parent having id %d\n",getpid());
```

```
}
printf("Common\n");
}
```

Terminal: gcc filename.c

./a.out

```
#include<unistd.h>
#include<sys/types.h>
#include<sys/wait.h>
#include<sys/wait.h>
int main()
{
pid_t p;
printf("before fork\n");
p=fork();
if(p==0)
{
printf("I am child having id %d\n",getpid());
printf("My parent's id is %d\n",getppid());
}
else
{
wait(NULL);
printf("My child's id is %d\n",p);
printf("I am parent having id %d\n",getpid());
}
printf("I am parent having id %d\n",getpid());
}
printf("Common\n");
}
```
